TSA Fleet Performance & Operations Analytics

💡 Insights & Recommendations 💡

Revenue Gap vs Potential

The fleet has the capacity to generate \$537.65M annually but captures only \$298.62M, 44% of its full potential remains unrealized.

Profit Margin is Healthy

For every \$1 earned, the company keeps \$0.65 as profit. The business is financially healthy despite the revenue capture gap.

Top 5 Customers Revenue Share

The top 5 accounts contribute only 11.95% of total revenue a healthy spread, meaning no single customer loss would be catastrophic.

Contract Customers Drive the Most Revenue

Contract loads lead at \$112.40M vs Spot (\$94.22M) and Dedicated (\$92.00M). Converting more spot accounts to long-term contracts would stabilize and grow revenue significantly.

First Group Is a Single-Point Revenue Risk

At \$10.39M, First Group generates \$3.12M more than the next closest customer. Losing this one account would immediately and painfully impact company revenue.

On-Time Delivery Rate Is Just Above Average

It Is a System Problem, Not a Driver Problem
No single driver in the scorecard exceeds 59% OTD. This confirms the issue is not individual driver behaviour but a systemic failure in scheduling, facility detention, or unrealistic delivery windows. Industry standard sits above 90%.

Busiest Drivers Are Not the Most Valuable

William Wilson completes 1,429 trips (\$4.9M). Joseph Jones does only 735 trips yet earns \$2.63M. Quality of loads matters more than trip volume.

Experience Does Not Predict Safety

Drivers with more years of experience were more prone to at-fault incidents suggesting overconfidence. Safety training must target veterans, not just new hires.

Charles Hernandez - Highest Safety Risk

6 incidents across 677 trips the highest in the entire driver scorecard. Requires immediate safety coaching and route review.

Fuel Efficiency Is Consistent Across All Drivers

The extremely narrow MPG range means driver behaviour has minimal impact on fuel consumption. Fuel cost differences are driven by truck age, route distance and road conditions not how drivers operate their vehicles.

Inactive Assets Generating Zero Revenue

23% of the fleet sits idle accumulating insurance and depreciation costs with no revenue return. Redeploy or liquidate these assets.

Freightliner Costs 67% More to Maintain Than Kenworth

Freightliner: \$1.12M vs Kenworth: \$0.67M. Future truck acquisitions should factor total cost of ownership, not just purchase price.

Fuel Surcharges Are Only Covering One-Third of Actual Fuel Costs

Total fuel cost is \$95.59M but only \$29.98M was recovered through surcharges, leaving \$65.61M absorbed by the company. The surcharge structure needs urgent renegotiation with customers. Every percentage point improvement directly adds to profit.

Incident Rate Is Low

Fleet Is Generally Safe. The overall incident rate is on the lower side relative to fleet size and trip volume, indicating a generally safe operation.

Chicago and Miami Are the Fleet's Biggest Danger Zones (11 Incidents Each)

Chicago and Miami record the highest incident counts, followed by Salt Lake City and Seattle at 10 each. Drivers operating these corridors need additional safety briefings, enhanced monitoring and route-specific risk protocols.
